LAB 07

Ensemble Learning

① Averaging method

② Boosting methode — Gradient, Ada, XGBoost

③ Stacking

→ Arrange algos in sequence. Then first algo will perform training
↳ output is updated by next algo.
↳ so next modal will update previous modal mistakes

→ 2 algos will train
↳ 1 algo will validate

Types of Ensemble learning:

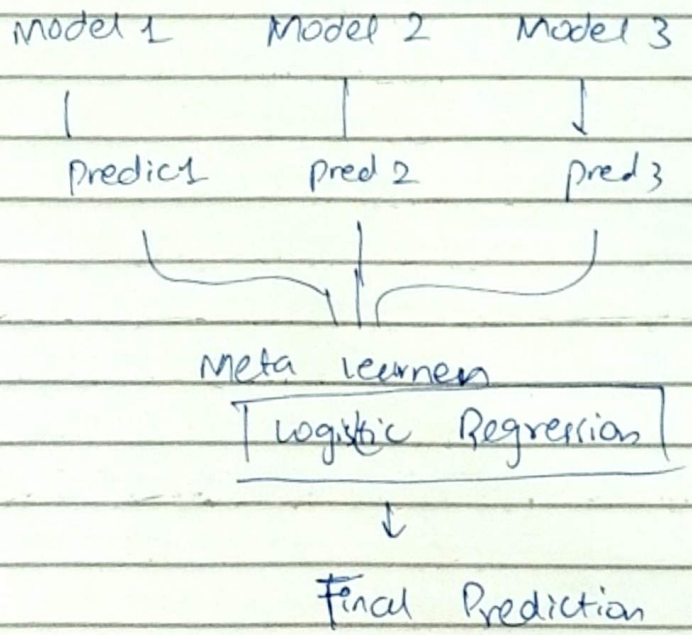

1. Bagging algorithm
2. Gradient Boosting algorithm
3. Ada Boost
4. XG Boost
5. Stacking Algorithm

=> Gradient Boost calculate overall loss of dataset.

=> AdaBoost has focus on the error in previous dataset or tree

=> XG Boost

=> Stacking

Bootstrap : If you used on set of dataset in one model, you cannot use same set of dataset for other model.
